PIXEL PALACE

Operations and Quality Control SOP

PP-SOP-005 | Version 1.0 (proposed) | Status: Draft for review

Startup Launch and Business Development Consultancy Team

Brand promise: Level up your day.

1. Purpose and operating principles

This SOP standardizes the daily delivery of Pixel Palace's gaming-zone services, from opening checks to customer service, equipment readiness, issue handling and closing reconciliation. It supports a clean, welcoming, reliable venue and clear accountability.

The Operations Officer owns routine operations. The Supervisor coordinates floor staff and shift execution. IT Manager owns technical readiness and repair triage; Security Manager owns security controls and emergency coordination; Finance Director owns cash-control and financial reconciliation procedures. The CEO resolves cross-functional priorities and material exceptions.

Operating hours already defined: Gaming zone 12:00–02:00 daily. Admin hours 10:00–18:00 Monday–Saturday. Floor shifts 11:00–19:00 and 18:00–02:00. The Operations Officer must arrange overlap and handover so opening, closing and overnight responsibilities are covered.

2. Daily workflow and task allocation

Opening and readiness (before 12:00)

- Supervisor assigns stations and responsibilities at the shift briefing; confirms attendance and handover notes.
- Operations Officer or delegated supervisor checks cleanliness, lighting, ventilation, seating, washrooms and customer-facing signage.
- IT Manager or trained delegate checks consoles/PCs, controllers, displays, network, approved accounts and basic functionality; defective equipment is tagged and removed from use.
- Security Manager or delegate checks entry points, emergency exits, first-aid access, visible hazards and security equipment according to the Security Measures SOP.
- Confirm current prices, offers, booking schedule, capacity limits and any unavailable stations are displayed accurately.
- Open to customers only after critical safety and service-readiness issues are resolved or the affected area is isolated and approved for limited operation.

During service

- Greet customers, explain available play options, pricing, time rules and conduct expectations before payment or play.
- Record bookings, session start/end times, payments and any approved discounts in the designated system or register.
- Keep walkways, exits, cables and shared areas clear; clean high-touch surfaces at the defined frequency and after spills.
- Monitor equipment condition and customer conduct; promptly isolate faults, hazards or abusive behavior.
- Escalate complaints, technical faults, stock shortages, suspected theft, injury or safety issues using the existing incident response targets.
- Maintain an accurate station-status board or register so customers are not promised unavailable capacity.

Shift handover and closing

- Outgoing Supervisor records open bookings, customer concerns, equipment faults, stock shortages, incidents, cash/transaction exceptions and follow-up owners.

- Incoming shift lead acknowledges the handover and checks urgent unresolved items.
- At closing, stop new sessions at the announced cutoff, complete customer checkout, secure equipment and restricted areas, and complete cash/transaction and incident records.
- Security Manager or assigned closer completes the closing checklist from PP-SOP-002; the final authorized person confirms doors, windows, power and alarms as applicable.
- Store records securely and send the daily operations summary to the Operations Officer.

3. Service delivery standards

Use a consistent customer journey: welcome → explain options and rules → confirm price and session duration → confirm payment/booking → provide equipment and brief usage guidance → monitor service → close session and invite feedback. Explain limitations before purchase and never promise a specific game outcome, uninterrupted availability or a refund unless policy allows it.

Staff should treat customers fairly, explain queue or booking delays honestly, and avoid favoritism. Accessibility requests, age-related questions or safeguarding concerns should be handled respectfully and referred to the Operations Officer or Security Manager when necessary.

Only authorized and trained staff may change system settings, access admin accounts, repair electrical equipment, handle restricted records or override pricing. Staff must not bypass licensing, account security, safety or payment controls.

4. Quality assurance checkpoints

Checkpoint	Minimum check	Owner / evidence
Opening	Cleanliness, safety routes, equipment status, pricing, booking readiness	Supervisor checklist
Each session	Correct station, start/end time, price, customer instructions	Booking/POS record
Throughout shift	Cleanliness, conduct, hazards, queues, equipment failures	Floor log and issue log
Fault reported	Stop use if unsafe; tag/isolate; log fault; notify IT/Operations	Fault ticket with time and owner
Customer complaint	Acknowledge, record facts, assign follow-up, close the loop	Complaint register
Closing	Secure assets, close transactions, record unresolved issues	Closing checklist and daily report
Weekly	Review recurring defects, customer feedback, consumables and staffing	Operations review
Monthly	Review service quality, incidents, maintenance, waste and trends	Monthly KPI report

Any item presenting immediate risk to people or property must be taken out of service or the affected area closed until it is safe. Do not allow sales pressure to override safety or equipment-integrity decisions.

5. Resource, equipment and inventory management

Maintain an asset register for consoles/PCs, displays, controllers, headsets, furniture, networking equipment, tools and other material assets. Record asset ID, location, condition, purchase/warranty information where available, assigned custodian and service history.

Maintain a stock list for consumables and frequently replaced accessories. Set minimum/maximum quantities based on actual use after the first month; do not invent reorder quantities. The Supervisor reports low stock; Operations Officer validates the request; Finance Director follows the approved purchasing and expense SOP.

Issue accessories against a station or session where practical. Check returned items for damage or missing parts and log exceptions without accusing customers before facts are established. Keep defective, repair-pending and ready-for-use equipment clearly separated.

IT Manager schedules preventive maintenance and software updates, coordinating downtime with Operations Officer. Backups, account access, software approvals and security reporting must follow PP-IT-001. Only licensed or otherwise authorized software and content may be used.

6. Delays, incidents and escalation

Priority	Existing response target	Examples / required action
Critical	15 minutes	Immediate threat, injury, fire, major security or privacy event: protect people, contact emergency services when required, notify Security Manager/Operations Officer/CEO and preserve records.
High	1 hour	Major station outage, serious customer complaint, suspected theft or service interruption: assign an owner, communicate impact and workaround.
Medium	1 working day	Non-urgent fault, stock issue or recurring service concern: log, assign and track resolution.
Low	3 working days	Minor improvement or cosmetic defect: record and schedule.

Response target means acknowledge, assess and assign—not necessarily complete full resolution by that time. If the assigned owner cannot resolve the issue, notify the Operations Officer and document the reason, customer impact, interim control and revised completion estimate. Do not conceal delays or mark work complete without verification.

For safety, security and incident documentation, also follow PP-SOP-002. For IT incidents, access controls and data loss, follow PP-IT-001. For complaints and customer communications, follow the Client Communication and Engagement Ethics SOP.

7. Corrective and preventive action (CAPA)

When a defect, complaint, repeated delay or failed check is found: (1) contain the issue and protect customers; (2) record facts and evidence; (3) identify immediate cause and, for recurring issues, root cause; (4) define corrective action to fix the current issue; (5) define preventive action to reduce recurrence; (6) assign one owner and due date; (7) verify effectiveness; and (8) close the record only after evidence is reviewed.

The Operations Officer maintains the CAPA log and reviews overdue actions weekly. The CEO decides on major resource trade-offs or operational changes. The Documentation & Compliance Coordinator may support record quality and policy alignment. Never alter records to hide a failed check.

8. Daily, weekly and monthly reporting

Report	Minimum content	Prepared by / reviewed by
Daily operations summary	Attendance/coverage, customer volume if available, station availability, revenue/transaction exceptions as provided by Finance, incidents, complaints, cleaning checks, stock alerts, open issues and next actions	Supervisor → Operations Officer
Weekly operations review	Faults by type, downtime, repeat complaints, maintenance due, inventory alerts, staffing gaps, CAPA status and decisions needed	Operations Officer with IT/Security/Supervisor
Monthly quality report	Service availability, customer feedback, complaint closure, incident trends, preventive maintenance completion, inventory variance, CAPA recurrence and improvement actions	Operations Officer → CEO

Use measured data where available and label estimates clearly. Do not invent customer counts, downtime, revenue or satisfaction scores. The Operations Officer keeps the report templates and source records in controlled storage.

9. Review and adoption

Review this SOP every 12 months or after a serious incident, material equipment/process change or recurring control failure. CEO reviews changes and Owner approves final adoption. Local emergency arrangements, equipment-specific instructions, maintenance frequencies and any legally required inspections must be confirmed before go-live.
