PIXEL PALACE

Business Continuity and Incident Response Plan

"Level up your day."

Document ID	PP-BCP-001	**Version**	1.0 (proposed)
Prepared	19 October 2026	**Document owner**	CEO; Operations, IT and Security leads
Approval	Owner approval	**Next review**	19 October 2027 (proposed)

1. Purpose and scope

This plan provides a practical, proportionate method to protect people, preserve essential records, communicate clearly, and restore Pixel Palace's gaming-zone and client services after a disruption. It applies to all employees, contractors and approved service providers. Safety of people takes priority over equipment, revenue or reopening speed.

2. Activation and command

Role	Primary responsibility during an incident
First person aware	Raise the alarm, protect people, stop unsafe activity, notify the Supervisor / relevant lead, and record the time and known facts.
Supervisor / Operations Officer	Coordinate floor response, pause affected activities, account for staff/visitors where safe, protect equipment, arrange service workarounds and maintain an incident log.
IT Manager	Triage system/network/device failures, protect data, preserve evidence, restore from approved backups and confirm systems are safe to use.
Security Manager	Control access, coordinate evacuation or security response, preserve CCTV/log evidence and liaise with emergency services when needed.
HR/Sales/Marketing Manager	Coordinate staff coverage and client updates; manage rescheduling, refunds/credits only under approved rules, and customer follow-up.
Finance Director	Protect cash/payment records, assess financial impact, track emergency spending and retain receipts.
CEO	Incident lead for significant disruptions; assigns priorities, approves business-wide communications and coordinates recovery.
Owner	Approves major closure/reopening decisions, exceptional expenditure and external statements where required.

3. Incident severity and response targets

Use the existing Pixel Palace incident targets as proposed internal service targets; life safety and urgent threats require immediate action regardless of the table.

Level	Examples	Target to acknowledge / respond	Initial action
Critical	Fire, serious injury, active violence, suspected major data breach, prolonged site-wide outage	15 minutes; immediately contact emergency services when needed	Protect people; stop operations or evacuate if required; alert CEO and relevant leads.
High	Payment/network failure affecting many customers, material security issue, significant data loss	1 hour	Contain impact, switch to safe workaround, notify CEO and affected leads.
Medium	Single station/device failure, limited service interruption, recoverable file issue	1 working day	Log ticket, assign owner, inform affected customer/staff if service is delayed.
Low	Minor defect or non-urgent improvement	3 working days	Record, prioritize and resolve through normal work queue.

4. Recovery priorities

Priority	Capability	Recovery objective / workaround
1 — People and premises safety	Fire, medical, security, safe access and evacuation	Immediate; do not resume until the responsible lead confirms safe conditions.

Priority	Capability	Recovery objective / workaround
2 — Communication and payments	Staff contact channels, customer notices, payment terminal/provider status	Restore a reliable communication route first; use only approved alternate payment methods. Never store payment-card data in ad hoc notes.
3 — Core gaming operations	Power, internet/LAN, game stations, consoles, booking and queue process	Restore a safe subset of stations first; communicate capacity limits and expected updates.
4 — Business records	Bookings, sales, finance records, staff schedules, incident logs	Restore verified backup copies and reconcile any transactions recorded during downtime.
5 — Full service and improvement	All stations, reports, promotions and non-essential systems	Return to normal only after checks, owner sign-off where required, and customer/staff communication.

5. Response playbooks

A. IT outage or system failure

• Confirm scope: one device, local network, internet provider, power, booking/POS system or site-wide issue. Record start time and error messages.

• IT Manager checks power/cabling, approved network equipment, service status and vendor contact route. Do not bypass security controls or install unapproved software.

• If safe and approved, move to a controlled manual queue/booking log. Use sequential references, record time and staff initials, and secure the log from public view.

• Give customers a factual update and realistic next-update time. Do not promise an unverified restoration time.

• After restoration, test connectivity, booking/payment flow, a sample station and security controls. Reconcile manual transactions and close the incident with root cause and prevention actions.

B. Data loss, suspected ransomware or account compromise

• Immediately alert the IT Manager and CEO. Disconnect affected device(s) from network only where this can be done safely without destroying evidence; do not power-wipe, reset or reinstall devices.

• Stop use of affected accounts/devices, preserve logs/screenshots and note who observed what and when. Do not forward suspicious files or messages.

• IT Manager identifies affected systems and backup integrity; use known-clean backups only after containment and security checks. Change credentials from a clean device and revoke compromised sessions where possible.

• CEO/Owner determine notification and service decisions with qualified legal/privacy advice where appropriate. Keep notifications factual, limited to need-to-know and consistent with applicable Pakistani law and contractual obligations.

• Validate restored data, access permissions and endpoint protection before reconnecting. Document what was lost, recovered, and still uncertain.

C. Security incident, threat or physical emergency

• For imminent danger, injury, fire or suspected crime, contact the appropriate local emergency service and follow the site evacuation/shelter instructions. Do not put staff at risk to protect property.

• Security Manager controls entry and exit where safe, keeps people away from hazards, preserves CCTV/access logs and records witness names/contact details with care.

• Do not confront a violent person or investigate a suspected criminal act alone. Restrict access to the scene and notify CEO/Owner.

• Reopen only after the hazard is cleared, affected equipment/areas are checked and the responsible lead records the clearance. Verify emergency numbers and evacuation arrangements locally before issue.

D. Operational disruption (power, cooling, equipment, premises or supplier)

• Stop use of unsafe or overheating equipment; isolate faulty equipment if safe. Do not open electrical equipment or attempt repairs without authorization.

• Operations Officer estimates the affected area and safe operating capacity, checks alternate stations and contacts the approved landlord/utility/vendor route.

• Pause new admissions or limit capacity if safe service cannot be maintained. HR/Sales/Marketing Manager communicates options for waiting, rescheduling or approved remedy.

• Use a phased reopening checklist: premises safety, power/network stability, station test, payment/booking check, staff briefing and customer notice.

E. Unexpected absence or client service interruption

• Employee informs their manager as early as practicable. Manager records the absence, checks urgent responsibilities and arranges a qualified cover or redistributes tasks.

• Do not share passwords or permit untrained staff to perform restricted work. Escalate coverage gaps affecting security, cash handling, IT administration or safe floor supervision to the CEO.

• For missed appointments, delayed bookings or interrupted service, contact affected clients promptly, explain known facts, offer approved alternatives and record the follow-up owner and due time.

6. Emergency communications

Audience	Channel / owner	Minimum content
Emergency services	Phone / person at scene	Exact site address, type of emergency, known injuries/hazards, callback number; follow dispatcher instructions.
Employees	Approved staff group/phone tree; CEO or assigned lead	What happened, affected area, immediate action, who is leading, next update time; no speculation.
Customers on site	Supervisor / staff in person and signage	Clear instructions, affected services, safe exit/alternative arrangements and assistance route.
Booked/affected clients	Approved business phone/email/social channel; HR/Sales/Marketing Manager	Service impact, available options, verified timing and contact for questions; protect other clients' details.
Owner / leadership	Direct call followed by written incident summary	Severity, people/safety status, operational impact, decisions required and next update.

Only the CEO or Owner, or a formally delegated spokesperson, may issue an external statement about a major incident. Staff must not post incident images, client information or speculation on personal social media.

7. Backup and recovery procedure

• IT Manager maintains an inventory of critical systems, data owners, backup locations, vendor contacts and restoration steps. Keep at least one protected backup copy separated from everyday user access where technically feasible.

• Back up business-critical records on a defined schedule approved by management. Verify backup completion and perform a documented restoration test at least quarterly as a proposed baseline.

• Keep backup credentials separate and restricted; use MFA where available. Retain backups according to an approved schedule and applicable obligations; securely dispose of obsolete copies.

• During recovery, prioritize clean environment and containment, restore the latest verified backup, validate record integrity and permissions, reconcile transactions, then obtain IT Manager and business-owner acceptance.

• If backups are unavailable or corrupted, preserve remaining copies, stop actions that could overwrite recoverable data, and obtain qualified support.

8. Continuity checklist and records

When	Required action / evidence	Owner
Immediately	Protect people; activate emergency response; record incident time and lead	First responder / Supervisor
Within initial response target	Assess severity, affected services, workaround, client impact and decision needs	Relevant lead / CEO
During disruption	Maintain incident log, decision log, staff/customer updates and expense evidence	Incident lead / assigned recorder
Before recovery	Confirm hazard contained, systems clean, backup valid and operational checks passed	IT / Security / Operations leads
After recovery	Reconcile records, notify affected clients, complete root-cause review and assign corrective actions	Incident lead and department owner
Within 5 working days (proposed)	Complete post-incident review for critical/high events; identify prevention owner and due date	CEO / relevant leads

9. Testing, training and maintenance

• Run a short continuity walkthrough at least annually and after major changes; test backup restoration quarterly as a proposed baseline.

• Keep staff call tree, local emergency contacts, landlord/utility contacts, IT vendor contacts, alternate workarounds and site evacuation instructions current.

• Review this plan every 12 months, after a critical incident, or when major systems/site arrangements change. CEO reviews; Owner approves.

Approval note: response targets, backup frequency, recovery times, retention periods, emergency contacts and customer remedies are proposed operational settings. Management must validate and approve them before formal issue.
